

# Scaffold Tower Safety Meeting Kit

## WHAT'S AT STAKE

Working with scaffold towers. It's not just about getting the job done; it's about making sure everyone goes home safe. The biggest concern is always the serious risk of falls, which can lead to severe injuries or even fatalities for anyone working on or around them. If safety isn't the top priority, it can cause major delays and mess up the whole project, costing time and money.

## WHAT'S THE DANGER

Let's talk about what makes scaffold towers potentially dangerous if we're not careful.

**Falls from Height:** This remains the most critical danger. Falls can occur from any level of the scaffold due to missing or inadequate guardrails, unsecured platforms, improper ladder use for access, or workers not using personal fall arrest systems correctly. The higher the fall, the greater the potential for severe injury or fatality.

**Scaffold Collapse:** A catastrophic event, a scaffold collapse can result in multiple injuries or deaths. Overloading the scaffold beyond its weight capacity, using damaged or incompatible components, improper assembly or dismantling, unstable ground conditions or inadequate foundations, and impacts from vehicles or equipment can all lead to structural failure.

**Falling Objects:** Tools, equipment, debris, or materials dropped from a scaffold can strike workers below or even members of the public, causing serious head injuries or other trauma. Proper toe boards, debris netting, and secure storage of materials on the scaffold are essential to prevent this.

**Electrical Hazards:** Contact with overhead power lines or improperly used electrical tools on the scaffold can lead to electrocution. Maintaining safe distances from power lines and ensuring proper grounding and insulation of electrical equipment are crucial.

**Environmental Factors:** Weather conditions such as high winds can destabilize scaffolds, making them unsafe to work on. Ice or snow can create slippery surfaces, increasing the risk of falls. Extreme temperatures can also affect worker performance and safety.

**Lack of Training and Competence:** Workers who are not properly trained in scaffold erection, dismantling, inspection, and safe use are at a significantly higher risk of causing or being involved in an accident. Competent supervision and regular safety briefings are essential.

## HOW TO PROTECT YOURSELF

### Before You Even Step On:

- Only use scaffolds if you've been properly trained on how to work on them safely. This includes knowing how to inspect them, what the weight limits are, and how to use fall protection.
- Before each shift, take a good look at the scaffold. Are all the parts there? Is it put together correctly? Are there any signs of damage like rust, bends, or cracks? If anything looks unsafe, don't go on it and report it immediately.
- Always use the required personal protective equipment (PPE), such as a hard hat, safety glasses, and sturdy work boots. If required, use a safety harness and lanyard properly attached to a secure anchor point.

### While You're On the Scaffold:

- **Keep it clean and clear:** Don't let tools, materials, or debris pile up. They can be tripping hazards or fall off and hit someone below.
- **Don't overload it:** Know the weight limit of the scaffold and don't exceed it. This includes you, your tools, and your materials.
- **Use guardrails and toe boards:** Make sure guardrails are in place and secure to prevent falls. Toe boards will help stop tools and materials from rolling off the edge.
- **Be aware of your surroundings:** Watch out for other workers, overhead power lines, and any changes in weather conditions. If it gets too windy or icy, you shouldn't be on the scaffold.
- **Climb safely:** Use ladders or designated access points to get on and off the scaffold. Don't climb on the frame itself.
- **Secure your tools:** Use tool lanyards to prevent your tools from falling and potentially injuring someone.

### If You're Working Below:

Even if you're working on the ground near a scaffold, it's crucial to stay aware of what's happening above you and make sure to never walk directly underneath where work is being done. Always wear your required Personal Protective Equipment (PPE), especially a hard hat, to protect yourself from any falling objects. Finally, pay close attention to and obey any warning signs or barriers that have been set up around the scaffold to indicate potential hazards.

## FINAL WORD

So, the key takeaway with scaffold towers is that safety isn't just a suggestion, it's something we all have to be on board with. When everyone makes safety a habit, that's how we make sure accidents don't happen and everyone heads home safe and sound.
