

The Risk of Using Desks and Chairs Instead of a Step Stool – School Safety Picture This

In the image, the worker is depicted balancing on a classroom desk to adjust a ceiling-mounted projector, demonstrating a serious safety risk. Using desks or chairs as substitutes for proper step stools or ladders is a common but dangerous practice that can lead to falls and injuries. Desks and chairs are not designed for stability during such tasks and may wobble or shift under weight, causing the worker to lose

balance. Additionally, the worker appears to be overreaching, further increasing the likelihood of an accident.

This situation serves as an important reminder of the dangers of improvising with inappropriate equipment in school settings. To prevent incidents like this, staff should use proper tools such as stable ladders or step stools specifically designed for reaching elevated areas. It is also essential to inspect the equipment for defects and ensure it is positioned on a flat surface. By promoting the correct use of safety equipment and discouraging unsafe practices, schools can significantly reduce risks and create a safer working environment for everyone.
