

Wildfire Smoke and Health Infographic

Wildfire season typically runs from early April to late October. As wildfire burns through forests and grasslands, it produces dense smoke that can be a major source of toxic air pollutants. This pollution contains fine particles (that are not visible to the human eye) that penetrate deep into our lungs and bloodstream, sometimes leading to serious health effects. Those at greater risk of these effects are:

- small children
- pregnant women
- elderly
- people with lung or heart conditions
- people involved in strenuous outdoor work or sports

Wildfire Smoke & Health

Smoke is an air pollutant

Mostly particles,
but also:

Use common sense to protect health

Limit time outdoors & avoid outdoor exercise

People with heart or lung issues should be especially careful

Call your doctor if you have symptoms: coughing, wheezing, chest pain, or nausea

Stay hydrated & get enough sleep

Keep windows closed, unless it's very hot

Run AC with fresh air intake closed & the filter clean

Turn off your whole house fan

Avoid skin contact with ash

Don't stir up ash

Fires **inside** or **outside** the county can send smoke and ash into our air

However, visible smoke plumes don't always mean that ground-level air quality is affected

Find hourly air quality readings
